

« *FertiRaisin* » natural fertilizer.

The vine can feed the vine...

To grow and to produce fruits, vine need to be feed with nutritive element that the roots take in the soil. The grower must give minerals the vine needs against the fruits. Without any fertilizer, little by little, vine impoverishes the soil with her roots, because each harvest steel some of the nutritive part of the soil.

To reconstitute this content in nutritive element, we made the choice of using a natural organic fertilizer 100% from the grapes instead of a chemical one.

« *FertiRaisin* », is a certified product usable in the organic culture for his composition. It is a good deal between a modern agriculture and our respect of the environment.

This natural fertilizer 100% from the grapes is named “ORGANIC” made from a wine making result (lees, marc,...) obtained by distillation.

Why organic fertilizer is better for the wine than a mineral fertilizer issues of a chemical industry ?

The organic content :

- Stimulate the biological activity of the soil (don't forget that the soil is alive).
- It improves the physical properties of the soil.
- It helps the soil keeping the minerals (avoid the pollution of the water table).
- Assure a disposability of the fertilizer element all along the vegetative cycle of the vine.

This is why « *FertiRaisin* » is a good natural fertilizer for the vine in an organic agriculture step.
